

Laptop Computers

Read Aloud Activity

Laptop computers are small portable computers. They weigh from two to six pounds and are easy to carry. Most people carry their laptop computer in a padded case that has a handle. The case protects the laptop.

A laptop computer is different from a desktop computer. Laptops are smaller, lighter, and sometimes they have less storage space.

Laptop computers allow users to check their email, write letters, and browse the Internet while they are away from their home or office.

Most laptops cost from \$400 to over \$1,500.
